

M51957A,B/M51958A,B

VOLTAGE DETECTING, SYSTEM RESETTNG IC SERIES

DESCRIPTION

M51957A,B/M51958A,B are semiconductor integrated circuits ideal for detecting input voltage and resetting all types of logic circuits such as CPUs.

They include a built-in delay circuit to provide the desired retardation time simply by adding an external capacitor.

Applications are extensive, including circuits for battery checking, level detecting and waveform shaping.

FEATURES

- Few external parts
- Large delay time with a capacitor of small capacitance ($t_d \approx 100\text{ms}$, at $0.33\mu\text{F}$) (M51957, M51958)
- Low threshold operating voltage (Supply voltage to keep low-state at low supply voltage) 0.6V (TYP.) at $R_L = 22\text{k}\Omega$
- Wide supply voltage range. $2 \sim 17\text{V}$
- Sudden change in power supply has minimal effect on the ICs
- Wide operation range of detecting input pin . . . Narrower ranges of $-0.3\text{V} \sim V_{CC}$ or $-0.3\text{V} \sim 7\text{V}$ (Input voltage detecting type)
- Suitable for high supply voltage circuit with simple circuit structure (M51957B, M51958B)
- Permits easy configuration of circuit for protection against reverse connection or surges. (M51957B, M51958B)
- Wide application range
- SIL package of the same height as DIP (5-pin SIP)

PIN CONFIGURATION (TOP VIEW)

Outline 5P5T

Outline 8P2S-A

NC: NO CONNECTION

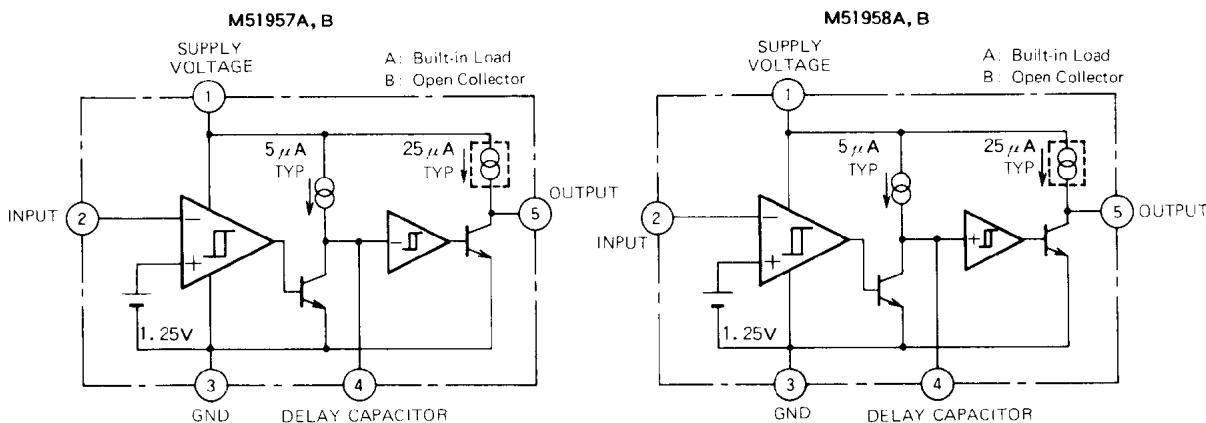

APPLICATION

Reset circuit of Pch, Nch, CMOS, microcomputer, CPU and microcomputer, Reset of logic circuit, Battery check circuit, Switching circuit back-up voltage, Level detecting circuit, Waveform shaping circuit, Delay waveform generating circuit, DC-DC converter, Over voltage protection circuit.

RECOMMENDED OPERATING CONDITION

Supply voltage range $2 \sim 17\text{V}$

VOLTAGE DETECTING, SYSTEM RESETTIC IC SERIES

EXAMPLE OF APPLICATION CIRCUIT

M5195XX Series Reset Circuit

Note 1. When the detecting supply voltage is 4.25V, M51951, M51952, M51953 and M51954 are used. In the case, R_1 and R_2 are not necessary. When the voltage is anything except 4.25V, M51955, M51956, M51957 and M51958 are used. In this case, the detecting supply voltage is $1.25 \times \frac{R_1 + R_2}{R_2}$ (V) approximately. The detecting supply voltage can be set between 2V and 15V.

Note 2. When the delay time is short, M51951, M51952, M51955 and M51956 are available. These ICs have a delay capacity and the delay time is about 200 μ s. If a longer delay time is necessary, M51953, M51954, M51957 and M51958 are used. In the case, the delay time is about 0.34 \times Cd(pF) μ sec.

Note 3. If M5195XX and the logic circuit have a common power supply, type A (built-in load type) can be applied whether a pull-up resistor is included in the logic circuit or not.

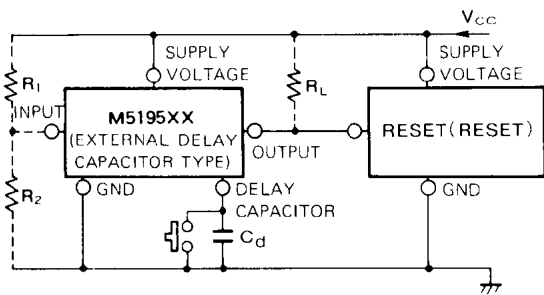

Note 4. The logic circuit preferably should not have a pull-down resistor, but if one is present, add load resistor R_L to overcome the pull-down resistor.

Note 5. When the reset terminal in the logic circuit is of the low reset type, M51951, M51953, M51955 and M51957 are used and when the terminal is of the high reset type, M51952, M51954, M51956 and M51958 are used.

Note 6. When a negative supply voltage is used, supply voltage side of M5195XX and the GND side are connected to negative supply voltage respectively.

Case of Using Other Reset Signal except Supply Voltage in the M5195XX Series

RESET AT TRANSISTOR ON

VOLTAGE DETECTING, SYSTEM RESETTING IC SERIES

Delay Waveform Generating Circuit

When M51957 and M51958 are used, a waveform with a large delay time can generate only by adding a small capacitor.

Operating Waveform

(a) M51957

(b) M51958

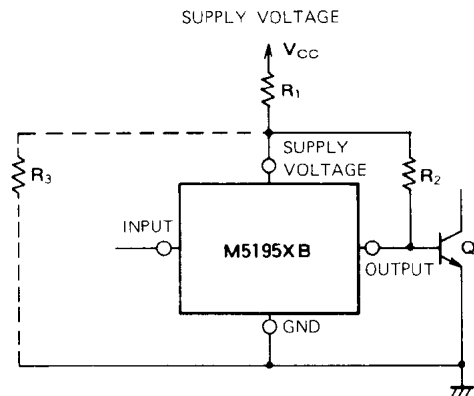

$$t_d \approx 0.34 \times C_d (\text{pF}) \mu\text{sec}$$

Application to High Supply Voltage Circuit

The absolute maximum rating of supply voltage for M51957B, M51958B is 18V. By dividing supply voltage

using resistors, these ICs can be used in high supply voltage circuit.

VOLTAGE DETECTING, SYSTEM RESETTING IC SERIES

In the above figure, the voltage applied to M5195XB is as follows. The voltage range is set between 2V and 17V.

at Q₁ ON:

$$\frac{R_2 \cdot \left[\frac{R_3}{(R_1+R_3)} \cdot V_{CC} - (R_1//R_3) \cdot I_{CC} \right] + (R_1//R_3) \cdot V_{BE1}}{R_2 + (R_1//R_3)}$$

at Q₁ OFF:

$$\frac{R_2 \cdot \left\{ \frac{R_3}{(R_1+R_3)} \cdot V_{CC} - (R_1//R_3) \cdot I_{CC} \right\}}{R_2 + (R_1//R_3)}$$

$$R_1//R_3 \equiv \frac{R_1 \cdot R_3}{R_1 + R_3}$$

V_{CC}: Circuit current of M5195XB

V_{BE1}: Base-emitter voltage ≈ 0.7V (Transistor Q₁)

This circuit provides reverse protection (in case of reverse connection of power supply) and surge protection.

Using the application circuit, the directly rectified or smoothing commercial voltage can be applied as shown below.
