MAXIMUM RATINGS (Tj = 25°C, unless otherwise noted) INVERTER PART

Symbol	Parameter	Condition		Ratings	Unit
Vcc	Supply voltage	Applied between P-N		450	V
VCC(surge)	Supply voltage (surge)	Applied between P-N		500	V
VCES	Collector-emitter voltage			600	V
±lc	Each IGBT collector current	Tf = 25°C		30	A
±IСР	Each IGBT collector current (peak)	Tf = 25°C, less than 1ms		60	A
Pc	Collector dissipation	Tf = 25°C, per 1 chip		60.6	W
Tj	Junction temperature		(Note 1)	-20~+125	°C

Note 1 : The maximum junction temperature rating of the power chips integrated within the DIP-IPM is 150°C (@ Tf ≤ 100°C) however, to ensure safe operation of the DIP-IPM, the average junction temperature should be limited to Tj(ave) ≤ 125°C (@ Tf ≤ 100°C).

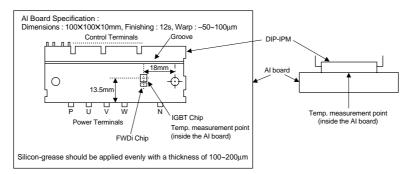

CONTROL (PROTECTION) PART

Note 4: Short circuit protection is functioning only at the low-arms. Please select the value of the external shunt resistor such that the SC triplevel is less than 51 A.

5: Fault signal is output when the low-arms short circuit or control supply under-voltage protective functions operate. The fault output pulse-width tFO depends on the capacitance value of CFO according to the following approximate equation : $CFO = 12.2 \times 10^{-6} \times tFO$ [F].

[C] Under-Voltage Protection (Upper-arm, UVDB)

- c1. Control supply voltage rises : After the voltage reaches UVDBr, the circuits start to operate when next input is applied. c2. Normal operation : IGBT ON and carrying current.
- c3. Under voltage trip (UVDBt).
- c4. IGBT OFF in spite of control input condition, but there is no Fo signal output.
- c5. Under voltage reset (UVDBr)
- c6. Normal operation : IGBT ON and carrying current.

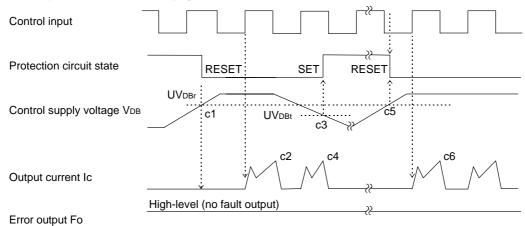

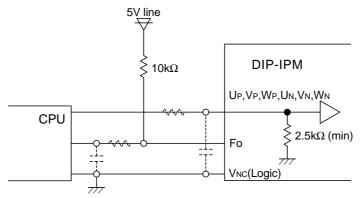

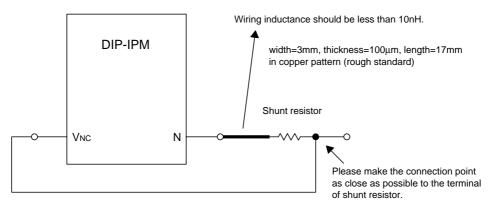

Fig. 6 RECOMMENDED CPU I/O INTERFACE CIRCUIT

Note : RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The DIP-IPM input signal section integrates a $2.5k\Omega(min)$ pull-down resistor. Therefore, when using a external filtering resistor, care must be taken to satisfy the turn-on threshold voltage requirement.

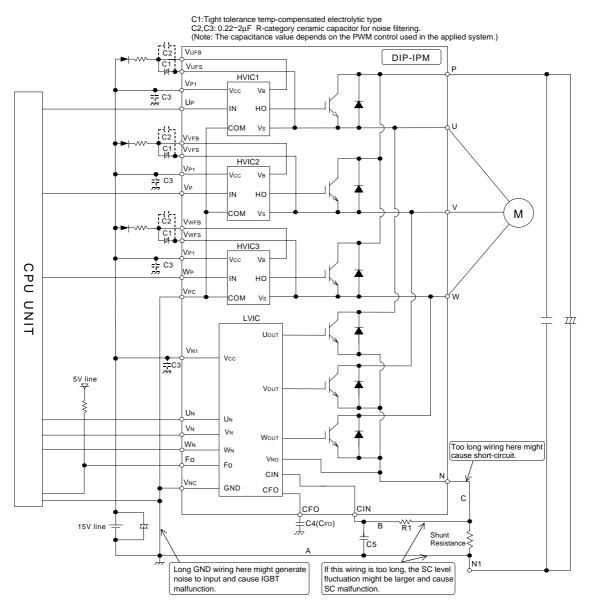

Fig. 7 RECOMMENDED WIRING OF SHUNT RESISTANCE

TRANSFER-MOLD TYPE INSULATED TYPE

Fig. 8 TYPICAL DIP-IPM APPLICATION CIRCUIT EXAMPLE

Note 1: To prevent the input signals oscillation, the wiring of each input should be as short as possible. (Less than 2cm)

- 2: By virtue of integrating an application specific type HVIC inside the module, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible.
- 3: Fo output is open collector type. This signal line should be pulled up to the positive side of the 5V power supply with approximately $10k\Omega$ resistor.
- 4: Fo output pulse width is determined by the external capacitor between CFO and VNC terminals (CFO). (Example : CFO = 22 nF \rightarrow tFO = 1.8 ms (typ.))
- 5: The logic of input signal is high-active. The DIP-IPM input signal section integrates a 2.5kΩ (min) pull-down resistor. Therefore, when using external filtering resistor, care must be taken to satisfy the turn-on threshold voltage requirement.
- 6: To prevent malfunction of protection, the wiring of A, B, C should be as short as possible.
- **7**: Please set the R1C5 time constant in the range $1.5 \sim 2\mu$ s.
- 8: Each capacitor should be located as nearby the pins of the DIP-IPM as possible.
- 9: To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 pins should be as short as possible. Approximately a 0.1~0.22μF snubber capacitor between the P&N1 pins is recommended.
